UK physicians either somewhat or strongly disagree that the NHS has the right digital infrastructure to support widespread introduction of AI that will make a difference.

We need to define the digital hardware needed in different clinical environments.

Digital systems don't talk to each other, aren't intuitive to use and hardware is often out of date or broken. We need to optimise existing digital systems.

We need to fix the NHS' digital infrastructure as the foundation for safely and successfully integrating AI into healthcare.

Clinicians must be part of the design and development of clinical digital systems and have training on how to use them.

Cybersecurity for NHS systems must be a priority for government.

There should be an electronic patient record model content specification standard for suppliers to meet.

Organisations should be 'digital plus' rather than 'digital only' to reduce digital exclusion and health inequalities.
